frequency optical source for generating light within said each WDM transmission channel for transmitting an optical signal on a unique wavelength within a designated range of wavelengths; and

at least one coherence division multiplexed (CDM) transmission unit disposed within said at least one individual WDM transmission channel, said at least one CDM unit comprising:

a second plurality of CDM transmission channels,

a broadband optical source for generating light within said at least one WDM transmission channel for transmitting said CDM optical signals via said second plurality of CDM transmission channels.

a light splitter for dividing said light generated by said broadband optical source into one reference path and a number of optical paths equal to a number of CDM transmission channels,

each said CDM transmission channel comprising a phase modulator and an optical delay line interconnected therebetween, said optical delay line comprising a temperature sensitive component for stabilization of phase drift caused by environmental fluctuations.
